My summary remarks

- The advent of GVCs is changing the nature of development policies.

  (In this regard) Governments can do a lot, and need to learn how, to **rethink policies in light of GVCs**. E.g.:
  
  - **Attract “better”** FDI and lead firms, with a GVC-consistent logic.
  
  - **Modify trade policies**: exports depend on imports, tariffs may multiply protection.
  
  - Innovation policies require considering that GVCs and their governance **coevolve** with Innovation Systems
1. GVCs are widespread and relevant
2. “Modern” industrial and innovation policies are increasingly accepted
3. A typology of GVC-oriented policies
4. Three examples: trade, investment attraction, and innovation policies (GVCs and innovation systems coevolve)

Services are also organized along GVCs

Figure 3. Services value-added embodied in manufacturing exports, 2015

Source: OECD, 2018.
1. Access to demanding and sophisticated markets
2. Access to knowledge, technology, organization,
3. Opportunities for learning and innovation

GVCs are not only a trade phenomenon
“Modern” Innovation and Industrial policies are beginning to be accepted

1. **Pragmatism**, empirically based. Conclusions are dependent on the context, no best practice to emulate (Pritchett).

2. Sharp **analytic approach to justify, define and implement policies** is required.

3. **A learning process.** Uncertainties and imperfect information urge policymakers to set up a process to discover the policies needed (Hausmann, Rodrik). Learning based on tentative, experimental, policy design and implementation (Sabel and Zeitlin, 2012).

4. Discovery requires **smart collaborations** between the government and the private sector. Complementary pieces of knowledge (Fernandez-Arias et al., 2018).

5. **Innovation** is an essential component of industrial policy.

6. **Outward orientation** is central.
Huge diversity of Innovation and industrial policies

- Industrial and innovation policy include things that are very different in nature.
- We need a **typology**, where we emphasize two dimensions:

  1. **Scope of the interventions** (horizontal or vertical).

  2. **Type of interventions**: public goods / public inputs, or market interventions (subsidies, tax exemptions, protection).

These two dimensions define a useful **2x2 matrix**, because every quadrant raises different public policy considerations.
Public Inputs

Market Interventions

Horizontal

- One-stop shop for business registration
- R&D subsidies

Vertical

- Phytosanitary controls
- Tax exemptions for tourism
Why does it matter?

The **public policy considerations differ in each quadrant:**

- The pros and cons differ
- The risk of rent seeking and “capture” by individuals or groups differ
- The difficulty of designing and implementing policies can also differ
- The institutional capabilities and requirements differ

<td>• “<strong>Force</strong>” externalities via training commitments and suppliers’ development</td>
<td></td>
</tr>
</tbody>
</table>
Three Examples of GVC-oriented Policies: How do policies change

1. Trade policy
2. Investment attraction
3. Innovation policy
1. Trade policies change

Average ad valorem Tariffs along the GVC, Selected Industries, 2015

- **Direct tariff on inputs**
- **Indirect tariffs on inputs**
- **Tariff on final exports**

- **Other transport equipment**
- **Motor vehicles**
- **Machinery**
- **Electrical machinery**
- **Computer and electronics**
- **Fabricated metal**
- **Basic metal**
- **Chemicals**
- **Textiles**
- **Food processing**

**Source:** TiVA database 2018 and TRAINS. Based on applied and preferential tariffs.

- Average ad valorem tariffs are higher if one considers **direct and indirect tariffs on inputs**, in addition to tariffs on final exports.
- Protection is higher for an economy requiring a large share of intermediate imports.
1. Trade policies change

- Goods cross borders many times, first as inputs and then as final products.

- Barriers at the border become costlier and have a **cumulative impact along the value chain** (OECD, 2018).

- Production activities which are linked to the GVC, are affected by tariffs faced in the destination market and across different countries.

- Who is effectively paying the cost of protection?

- Antimiani et al., 2018 show that the total impact of tariffs can have a significant cumulative impact because of trade in intermediates. The “beggar thyself” content of protectionism.
2. FDI and GVC attraction policies
The missing link in the value chain: sterilization of medical devices in Costa Rica
2. Investment and GVC attraction policies

- The **medical devices** sector targeted by CINDE, Costa Rica, for many years. The sector expanded since Baxter’s arrival in 1987, to reach US$1.5 billion exports in 2014.

- However, **only low-complexity disposable medical devices were exported**, and not, for example, heart valves or other cardiovascular devices. The latter needed a process of **sterilization**, not available locally.

- Why did not any activity of sterilization develop in the country? A “chicken-and-egg” problem. The **market did not solve the problem by itself**......

- In 2013 Costa Rica exported US$300 m. in therapeutics and US$500 m. in surgical and medical devices. Disposables fell from 90 to 50%.

- **CINDE targeted sterilization because it realized that a segment of the value chain was missing**, and that the market would have not solved the problem.
3. Innovation policies also need to consider the emergence of GVCs
The coevolution of GVCs and the Innovation System and Capabilities’ Development

Global value chain(s)
Governance

Local firms
Learning
Intensity and mechanisms

<td></td>
</tr>
</tbody>
</table>
**Trends in FVA – Foreign Value Added**: Inter- and Intra-sectoral upgrading, with *fall in FVA* and simultaneous increase in local VA. This did not happen in LA.

This coincided with the degree of localization of knowledge, measured by *patents self-citation*, i.e. the development of a NIS.

Perils and potential of GVCs

- The *in-out-in Trajectory* may unfold if IS is relatively well developed,
- It is necessary due to the risk of losing ground to cheaper locations.

They suggest that:

a. In the **Preliminary Development** stage GVC participation is necessary to acquire foreign knowledge and production skills, OEM

b. In **Intermediate stage** separation and independence from existing foreign-dominated GVCs is required for functional upgrading. ODM and OBM. This requires building capabilities in design, R&D, marketing, and an IS.

c. In the **Maturity stage** latecomer firms and economies build their own GVCs, after facing rising domestic wages

New technologies - **short cycle technologies** - which rely less on existing knowledge stocks, offer **better opportunities for latecomers**.

- Clear strategic and risky decision is required. E.g. Hyundai’s choice to break up with Ford, and then with Mitsubishi, after they refused to teach about engine technologies.

1970s-mid-80s growth through GVC integration, then decline in mid-2000s, with China entering the market.

- One group remained with low price products, passive learning, low interactions with other actors: only product upgrading

- Another group (*Arezzo, Alpargatas, Grendene*) targeted high-end markets, developed local learning mechanisms, R&D, professional designers, patents, created their own GVCs.

Policies changed but firm-level strategies proved essential.
